Research guidelines

Jan van Gemert, j.c.vangemert@tudelft.nl

September 18, 2019

The goal of this document is to give structure to doing research with me. Benefit for you: avoid my comments by following these guidelines.

Organization	Process	Mentality
O1 Full Responsibility O2 No dependencies O3 Meet supervisor O4 Focus supervisor O5 Take critique O6 Constructive disagree O7 Analyze results O8 Suggest solutions	P1 One main Q P2 Min. 3rd party P3 Validate P4 First break it P5 Depth first P6 Exps answer Q P7 Proof of concept P8 Exps max 1 night P9 Change 1 var P10 Debug science	M1 Be critical M2 Find ToDos together M3 Consistency M4 Question everything M5 Simple is strong M6 Limitations M7 Write early and often M8 Not Eureka

Research organization

- O1. Take full responsibility. This is your project. Not your adviser's. You are in charge of everything, including: planning, progress, direction, meeting topics, bureaucratic formalities, etc. Your adviser's role is to advise and help you as best as possible, yet the final responsibility remains yours.
- **O2.** No dependencies. Avoid dependencies on third parties. Such parties intend well, yet reality is often different from expectations. Do not become the victim of this and make sure you have full control. E.g.: Promised datasets, experts, constraints, or other agreements have to be there *before* you start.

- **O3.** Meet your adviser. Try to see your adviser at least once every 2 weeks; once per week is better.
- **O4.** Focus your adviser. Meeting time is limited. It is your responsibility to choose to discuss what benefits you most.
- **O5.** Do not take criticism personal. All feedback is meant to improve and benefit you. Do not fight the feedback, even if you think it is wrong: Make a note, and think about why your supervisor gave this feedback.
- **O6.** Constructive disagree. It's OK to disagree with a suggestion of your adviser, but if you do: propose something else.
- **O7.** Analyze results. When presenting (intermediate) results, give an interpretation and conclusions.
- **O8.** Suggest solutions. when encountering research or organizational problems: suggest a solution.

The research process

- P1. Only one main research question / problem statement. It may change over time but explicitly pursue a single topic: Try to write it down.
- **P2.** Minimal effort for 3rd party building blocks. If you build on top of existing work (e.g. an optimizer, object detector, pose estimator) start with the *least effort* approach to obtain this building block. It should not matter which building block you take, so start with the easiest available implementation. If you work modularity, you can always add another one later.
- **P3.** Validate published work. It is not obvious that a published work generalizes to your problem. There may be subtleties: Validate this.
- **P4.** Prioritize idea breaking. Start by investigating the greatest risk to your main research question. Do not invest heavily on the foundations, only to find out months later that the main idea did not work.

- **P5.** Depth-first instead of breadth-first. Do not explore sub-topics too deep. Identify the minimum requirement per sub-topics and get to this minimum as soon as possible. Try to get ASAP to a first full version to validate your idea. More baselines/variants/datasets can always be done later.
- **P6.** Experiments answer a single question. Write down before you do an experiment what your expected answer to the question is. Validate.
- P7. Show proof of concept. Start with a fully controlled (possibly toy) dataset of 'the simplest case possible' which should only vary in the relevant manner. Its goal is to validate that the problem occurs and/or that your model can solve it.
- **P8.** Experiments take max 1 night. If it takes 1 week, you can only do 24 in 6 months. Minimize experimental time so you can answer more questions.
- **P9.** Change only one variable. If more than one variable is changed, it is not possible to determine the cause of an effect.
- P10. Debug your scientific ideas and your code. Test ideas and test code every time you make a change. Start with the assumption you made a mistake somewhere, gather independent proof that it is correct.

Research mentality

- M1. The critical reviewer. Often switch roles to a savage reviewer (Mr Hyde) who is looking for any excuse to say: 'I do not believe X; Reject.' Try to identify X yourself and think about which evidence argues for X.
- M2. Your supervisor does not have the answer. We are doing research. By definition, this research has not been done before. Thus, it is impossible for your supervisor to give you a list of ToDos: We'll find them together.

- M3. Be consistent. Assumptions you make in one part of your research should not suddenly change in another part.
- M4. Question everything. Take a step back, and think about what you are really doing. Does the story logically make sense? Try to see the things you take for granted: Is everything justified?
- M5. Simple is strong. Simple is more powerful than complex. Explain the core of your topic to a layman (your mother?) without using math/jargon. If you cannot explain it, it is probably too complex.
- M6. Limitations. What are the limitations of your method. No method will always be the best. Showing insight where it fails is strong. The goal of research is understanding.
- M7. Write early and often. Writing is important. It helps to make thoughts concrete and it is the interface to your work. Writing always takes longer than you think and it benefits from iterations.
- M8. Not "Eureka" But "Thats funny". (by Asimov) is the most exciting phrase in research. It becomes most interesting when expectations break.
